

SEMINARIUM RENTGENOWSKIE

Dnia 19.01.2016r. o godz. 10.30, w sali D Instytutu Fizyki PAN, odbędzie się seminarium rtg., na którym **dr. Damian Paliwoda** z European Synchrotron Radiation Facility (Grenoble, France) wygłosi referat, przygotowany w ramach projektu EAgLE, na temat:

"High Pressure Physics and Chemistry at the European Synchrotron Radiation Facility"

Streszczenie:

Like temperature, pressure can be considered as an effective tool for tuning crystal structure by changing energetic hierarchy of non-bonding forces. Pressure can induce phase transitions and structural changes leading to new molecular arrangements of varied physical properties, such as crystal polarity, magnetic and/or optical properties.

The last several decades have shown that unexpected physical and structural behaviour at high and ultra-high pressures is the rule rather than the exception.

The presentation will be divided into two parts. In the first part a short introduction and history of high-pressure research will be presented. This part includes the breakthrough invention of a diamond anvil cell, its design and implementation in high-pressure diffraction experiments at laboratories and large synchrotron facilities. A short description of High Pressure Station ID09A will be given.

Several examples of pressure-induced transformations are going to be discussed in the second part of a contribution. They will include pressure effects on simple elements like lithium [1] or oxygen, [2] phase transitions in molecular crystals (e.g. in ferrocene [3]), spin-crossover effects in iron compounds [4] and high-pressure synthesis of new stoichiometries of sodium chloride. [5].
